Worldwide

The digital revolution has advanced into many areas of our lives. For most people, digital technologies are now an intrinsic part of both working life and leisure time. In many ways, they enrich our life and make it easier - for example, by making information and resources accessible, providing a diverse range of communication platforms, and taking on monotonous or dangerous jobs. Highly complex systems can now detect cancer cells in tissue samples more quickly and efficiently than ever before, or brake vehicles ahead of a potential collision. But these technologies also harbor risks. Many everyday interactions require us to divulge a huge amount of personal information - used by unknown entities to bombard us with news, marketing and political messages. The question remains: Who - or what - are the better decision-makers. Humans or machines?

- 1 The Artist's Code - Can Algorithms Be Creative? (2021)
